

ABSTRACT OF THE DISCLOSURE

When a print order is placed for image data via a network, the same image data are prevented from being transferred again and freedom of order placement can be improved in terms of time. The image data transferred to a print order reception center are stored in a database. When a user places an order by using a user terminal, a list of the image data stored in the database is displayed on the user terminal. The user places the order while viewing the list.
